

P2Y12 mouse specific

Cat.No. 476 011; Monoclonal mouse antibody, 100 µg purified IgG (lyophilized)

Data Sheet

| | |
|----------------------------|---|
| Reconstitution/ Storage | 100 µg purified IgG, lyophilized. Albumin and azide were added for stabilization. For reconstitution add 100 µl H ₂ O to get a 1mg/ml solution in PBS. Then aliquot and store at -20°C to -80°C until use. Antibodies should be stored at +4°C when still lyophilized. Do not freeze! For detailed information, see back of the data sheet. |
| Applications | WB: not recommended IP: not tested yet ICC: not tested yet IHC: 1 : 1000 up to 1 : 10000 (see remarks) IHC-P (FFPE): 1 : 1000 up to 1 : 10000 IHC-Fr: 1 : 1000 (see remarks) |
| Clone | SY-341D12 |
| Subtype | IgG2b (κ light chain) |
| Immunogen | Synthetic peptide corresponding to residues near the carboxy terminus of ms P2Y12 receptor (UniProt Id: Q9CPV9) |
| Reactivity | Reacts with: mouse (Q9CPV9). No signal: rat (Q9EPX4), human (Q9H244). Other species not tested yet. |
| Specificity | K.O. validated |
| Remarks | IHC: Antigen retrieval with citrate buffer pH 6 is tolerated. IHC-Fr: Methanol fixation is recommended. |

TO BE USED IN VITRO / FOR RESEARCH ONLY
NOT TOXIC, NOT HAZARDOUS, NOT INFECTIOUS, NOT CONTAGIOUS

Background

P2Y12 receptor (P2RY12) is a G_i – coupled purinoceptor and is of particular relevance for microglia in the central nervous system (CNS) (1). The preferred agonist is ADP, the degradation product of ATP, which is released from neurons and other glial cells during physiological activity or after tissue damage. P2Y12 receptor is highly expressed in processes and somata of surveilling microglia and plays a major role in microglial chemotaxis in response to local CNS injury (2). More recently, P2Y12 receptors have been shown to be concentrated at microglia process-neuronal somata contacts (3) and to be critical for neuroprotection. To date, P2Y12 receptor is one of the most accepted microglia-specific markers used to distinguish CNS-resident microglia from CNS-associated macrophages (CAMs) and infiltrating monocytes/macrophages (4). The expression level of P2Y12 receptor is downregulated in an activated state of microglia referred to as disease-associated microglia (DAM). In the periphery, P2Y12 receptor is expressed in platelets and is a well-known biological target for anti-thrombotic drugs due to its central role in platelet activation, aggregation and blood clotting (5).

FAQ - How should I store my antibody?

Shipping Conditions

- All SYSY antibodies and control proteins/peptides are shipped lyophilized (vacuum freeze-dried). In this form, they remain stable without loss of quality at ambient temperatures for several weeks.

Storage of Sealed Vials after Delivery

- **Unlabeled** and **biotin-labeled antibodies** and **control proteins** should be stored at **4°C** before reconstitution. **Do not freeze lyophilized antibodies.** Temperatures below 0°C may impair performance.
- **Fluorescence-labeled antibodies** should be reconstituted immediately upon receipt. Long-term storage of lyophilized fluorophore-conjugates may cause aggregation.
- **Control peptides** should be stored at -20°C before reconstitution.

Long Term Storage after Reconstitution (General Considerations)

- **Do not use frost-free (“no-frost”) freezers.** These units periodically warm to remove ice buildup, causing freeze–thaw cycles that can damage antibodies.
- Store vials in areas with minimal temperature fluctuation - preferably toward the back of the freezer, not on the door.
- Aliquot reconstituted antibodies and store at –20°C to –80°C.
- Avoid very small aliquots (<20 µL), as evaporation and adsorption to tube surfaces can reduce antibody concentration and activity.
- Use the smallest practical storage vial to minimize surface area.
- Adding glycerol to a final concentration of 50% prevents freezing at -20°C, allowing storage in liquid form and effectively avoiding freeze–thaw cycles.

Product Specific Hints for Storage

Control proteins / peptides

- Store at -20°C to -80°C

Monoclonal Antibodies

- **Ascites and hybridoma supernatant:** Store at -20°C to -80°C. Prolonged storage at 4°C is not recommended, as proteases present in ascites may degrade antibodies.
- **Purified IgG:** Store at -20°C to -80°C. Adding a carrier protein (e.g., BSA) enhances long-term stability. Many SYSY antibodies already contain carrier proteins - refer to the respective datasheet for details.

Polyclonal Antibodies

- **Crude antisera:** Can be stored at 4°C with antimicrobials added, but -20°C to -80°C is preferred
- **Affinity-purified antibodies:** Less stable than antisera; store at -20°C to -80°C. Adding a carrier protein such as BSA improves long-term stability. Most SYSY antibodies already contain carrier proteins - refer to the respective datasheet for details.

Fluorescence-labeled Antibodies

- Store as a liquid with 1:1 (v/v) glycerol at -20°C, and protect from light exposure

Avoid repeated freeze-thaw cycles for all antibodies!

FAQ - How should I reconstitute my antibody?

Reconstitution

- All purified SYSY antibodies are lyophilized from PBS. To reconstitute the antibody in PBS, add the volume of deionized water specified in the corresponding datasheet. If a larger final volume is desired, first add the recommended amount of water, then adjust with PBS and, if needed, add a stabilizing carrier protein (e.g., BSA) to a final concentration of 2%. Some SYSY antibodies already contain albumin; please take this into account before adding additional carrier protein.

For complete reconstitution, carefully remove the vial cap. After adding water, briefly vortex the solution. To collect the liquid at the bottom of the vial, place the vial inside a 50 ml centrifuge tube padded with paper and centrifuge briefly.

- If desired, small amounts of azide or thimerosal may be added to prevent microbial growth. This is particularly recommended when storing an aliquot at 4°C.
- After reconstitution of fluorescence-labeled antibodies, add glycerol 1:1 (v/v) to achieve a final concentration of 50%. This prevents freezing at –20°C and keeps the antibody in liquid form, effectively avoiding freeze–thaw cycles.
- Glycerol may also be added to unlabeled primary antibodies as a general measure to prevent freeze–thaw damage.
- For further guidance, please refer to our **storage tips** and recommendations for reconstituted antibodies, control peptides, and control proteins.
