#### Background

Ionized calcium-**b**inding adaptor **m**olecule **1** (**IBA1**) or allograft inflammatory factor**1** (**AIF-1**) is an EF hand calcium binding protein which is expressed by cells of the monocyte/macrophage lineage and by germ cells in the testis (1). In mice, IBA1/AIF-1 can be regarded a "pan-macrophage marker" because, except for alveolar macrophages, all subpopulations of macrophages express IBA1/AIF-1 (1). In human gliomas IBA1 defines a distinct subset of tumor-associated activated macrophages/microglial cells (2).

Microglia represent the resident macrophages in the nervous system and are the smallest of the glial cells with cell bodies of only 2-5 µm in diameter. In the CNS IBA1 upregulation is associated with

neuroinflammatory response (3).

#### Background

The family of S100 proteins comprises more than 20 members. These proteins are EF-hand Ca<sup>2+</sup>-binding proteins, and are widely distributed in mammalian tissue. Since these proteins are soluble in 100 % saturated ammonium-sulfate solution they have been named S100. **S100B** is a frequently used marker protein for mature astrocytes whereas GFAP is also expressed in germinal zone cells that maintained their immature developmental stage.

Sex determining region of Y chromosome (**S**ry)-related high mobility group b**ox1-3** or **SOX 1-3** proteins belong to the earliest transcription factors expressed in the developing CNS SOX1, SOX2 and SOX3 constitute the B1-subgroup of the Sox gene family 12. #### Background

The 2', 3'-cyclic nucleotide 3'-phosphodiesterase **CNP 1**, also referred to as CNPase and CNP, is one of the most abundant membrane-associated enzymes in the myelin sheath of the vertebrate nervous system.

It is assumed that CNP 1 participates in RNA metabolism of myelinating oligodendrocytes.

#### Background

The two major cytoskeletal proteins involved in cell motility are myosin and **actin**. Monomeric actin is a globular protein that is expressed in all eukaryotic cells. Actin is the major subunit of microfilaments, a major component of the cytoskeleton, and of thin filaments, part of the contractile apparatus in muscle cells.

Actin is involved in many cellular processes including cell motility, maintenance of cell shape, and organelle trafficking.

Three main groups of actin have been identified.  $\alpha$ -actins are found in muscle tissues whereas  $\beta$ - and  $\gamma$ -actins co-exist in most cell types as components of the cytoskeleton.
